

NEWS & ALERTS

The News & Alerts tab was designed to ensure that users have an easy, clean interface to navigate. The News feed will automatically update using open data on current trending news stories. The alerts feature will flash if/when there is any alert pertaining to any areas regarding your flight.

PROFILE UI

The tap of the hamburger icon will reveal a profile user interface that allows the user to customize their experience. The profile UI will indicate things like, the type of level of user you are, the frequency of flights, and will offer a personalized greeting.

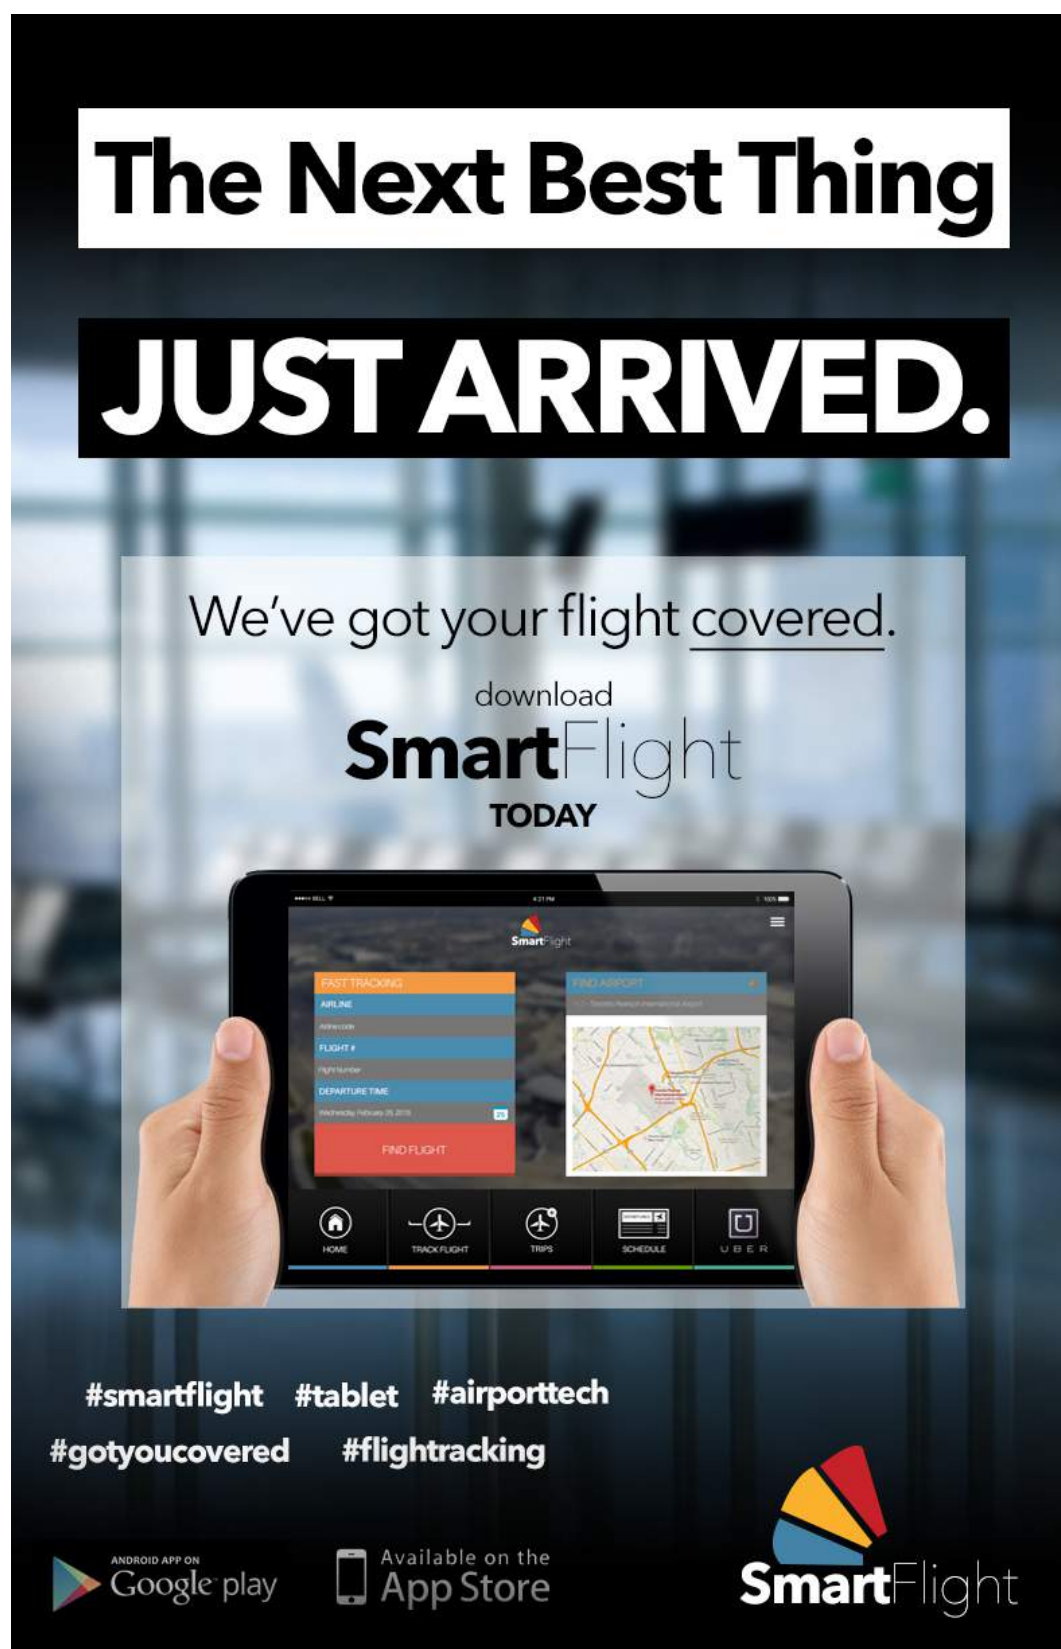

UBER Integration

The UBER tab allows a user to order a cab and ensure that there is no wait time between their flight and their destination. The interface details all of the necessary information that a user would be interested in. This was determined during our UX research. SmartFlight's UBER feature would be part of the "premium" business model in this prototype.

ONLINE TICKETING

The online boarding pass allows premium users to always have a copy of their online boarding pass. This feature will work in the same way as most ticketing applications do.
